                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acid molecule modulating VEGF receptor(s) gene expression or stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                Gaps
which the gene is involved, or as target molecules for gene therapy
                                                                     The present invention relates to novel human secretory or membrane proteins (ADA54072-ADA55710) and their coding sequences (ADA52433-ADA54071). The coding sequences are useful in the gene therapy of diseases caused by abnormalies of the proteins, e.g. cancer, inflammatory diseases, osteoporosis or neurological disease. The proteince was used in an example from the invention.
                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Mouse flt-1 VEGF receptor hammerhead ribozyme substrate #647
                                                                                                                                                                                                                                        Query Match

Detecting nucleic acids for the diagnosis of heritable genetic disorders and for the detection of microbial organisms in food and biological

Example 7; Page 25; 74pp; English.

This invention describes a novel method (I) for detecting nucleic acids using novel primers and an integrated signaling system. (I) may be used for the detection of variations genomic DNA samples (e.g. from humans, animals and plants). It is particularly useful for detecting inherited diseases (by detecting abnormalities in DNA from patients) and microbial infections (e.g. human immundeficiency virus (HIV) and Hepatitis C infections (e.g. human immundeficiency virus (HIV) and Hepatitis C viruses or bacterial infections of food). (I) provides high levels of sequence specificity, detection sensitivity and high rates of signal amplicity and allowing enhanced specificity based on the ready availability of a target binding region (TargBR) for hybridization with product is the target species so the output signal obtained is directly related to the amount of extended primer. (I) is not dependent on additional hybridization events or enzymatic steps intra- and inter-clarand competition for the probe site is limited so the probe design is simplified and probes which fail to bind under standard assay conditions in separate probe formats may function in (I). Additionally, homogenous assay formats may be derived from (I). Finally, as the interaction is unimplement, the signal reaction is very rapid, permitting increased to the interaction is very rapid, permitting increased in the method of

This invention describes a novel method (I) for detecting nucleic acids using novel primers and an integrated signaling system. (I) may be used using novel primers and an integrated signaling system. (I) may be used for the detection of variations genomic DNA samples (e.g. from humans, and plants). It is particularly useful for detecting inherited diseases (by detecting abnormalities in DNA from patients) and microbial confections (e.g. human immunodeficiency virus (HIV) and Hepatitis C infections (e.g. human immunodeficiency virus (HIV) and Hepatitis C viruses or bacterial infections of food). (I) provides high levels of sequence specificity, detection sensitivity and high rates of signal apparance. Only a single detector/primer species is required (improving simplicity and allowing enhanced specificity based on the ready availability of a target binding region (TargBR) for hybridization with product is the target binding region (TargBR) for hybridization with product is the target species so the output signal obtained is directly related to the amount of extended primer. (I) is not dependent on product is the probes which fail to bind under standard assay conditions in separate probe formats may function in (I). Additionally, homogeneous sensely formats may be derived from (I). Finally, as the interaction is unimplement, the signal reaction is very rapid, permitting increased the invention the invention

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NG20). The regulates expression of a neurite growth inhibitor gene (NG20). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NXM motif) an amberzyme (cleaving RNA with an NGM triplet), a zinzyme (cleaving RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg^22+. The cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma (NHL), bulky low-grade or follicular non-Hodgkin's lymphoma (NHL), bulky low-grade or follicular nucleicalled with (human immunodeficiency virus) associated NHL, mantle-cell

Homo sapiens

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NOGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids an Inozyme of a nucleic acids (e.g. a ribozyme or a nucleic acids an INDM motif), a G-leaver (cleaving RNA with a NRM motif) a G-leaving RNA with a NRM motif) an amberzyme (cleaving RNA with a NRM motif) an amberzyme (cleaving RNA with a NRM motif) and a memberzyme (cleaving RNA with a NGW motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg²+. Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukamia, becall lymphoma, leukamia, becall lymphoma, (NLI), bulky low-grade or follicular NHI, lymphocytic context lymphoma (NLI), immunocytoma (INC), small B-cell lymphocytic lymphocytic lymphoma (NLI), immunocytoma (INC), small B-cell lymphocytic lymphocytic argetting nucleic acid is used to cleave RNA of the NOGO gene in the presence of a divalent cation that is preferably Mg²+. Furthermore, the nucleic acid may be contacted with a cell to reduce NOGO activity of the nocontercapy-induced neuropathy, the NOGO-targetting nucleic acid may be contacted with a cell to reduce NOGO activity of the contact a patient having a condition associated with the level of therapies. In particular, the NOGO-targetting nucleic acid may be contacted with a cell to reduce NOGO activity of the contact a patient having a condition associated with the level of therapies. In particular, the NOGO-targetting nucleic acid may be contacted with a cell to reduce NOGO activity of the contact system (CNS) injury and cerebrovascular a central n

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.

Claim 88; Page 84; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGO2). The conjustes expression of a neurite growth inhibitor gene (NGO2). The conjustes expression of a neurite growth inhibitor gene (NGO3). The nucleic acids (e.g. a ribozyme or a nucleic acids as a ribozyme or a conjusted an inozyme (aleaving RN with a NRY motif) proposessing an NCH motif), a G-cleaver (cleaving RN with a NRY motif) proposessing an NCH motif), a G-cleaver (cleaving RN with a YGY motif). The CD20-targetLing nucleic acid is used to cleave RNA with a YGY motif). The CD20-targetLing nucleic acid is used to cleave RNA coff CD20 in the presence of a divalent cation that is preferably MG² +. Coff CD20. The treatment may further comprise the use of one or more coff color. The treatment may further comprise the use of one or more coff color. The treatment may further comprise the use of one or more coff color. The treatment may further comprise the use of one or more cleavagenis, and inflammatory arthropathy. The NOGO-color largetting nucleic acid may be contacted with a cell to reduce NOGO gene in the treatment may further comprise the use of one or more correct may be contacted with a cell to reduce NOGO gene in the color of a divalent cation that is preferably MG² +. Furthermore, the nucleic acid may be contacted with a cell to reduce NOGO gene in the color of a divalent cation that is preferably MG² +. Furthermore, the NOGO. The treatment may further comprise the use of one or more color divalence a patient having a condition associated with the level of the color of the cell and treat a patient having a condition associated with the level of the color and cells and divalence a divalence of disease, demented and condition associated with the level of parkingon's disease, ataxia, Huntington's disease, centered to the repond to the modulation of NOGO expression. The present of the analysis of the constr sequence is an inozyme of the invention

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury. Claim 88; Page 131; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down control of a neurite growth inhibitor gene (NGOD). The concleic acids may be enzymatic nucleic acid (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acid cleaving a an RNA molecule CD possessing an NCH mocif,, a G-cleaver (cleaving RNA with a NGH woith) and NGH woith, a zinzwme (cleaving RNA with an NGH woith) a zinzwme (cleaving RNA with an NGN triplet), a zinzwme (cleaving RNA with an PGD20-targetting nucleic acid is used to cleave RNA cc C CD20 in the presence of a divalent cation that is preferably NG²+.

C Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more contacted with a cell lymphoma, low-grade or follicular non-contacted with a cell lymphoma, lymphocytic cleaksemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, confined and patient cation that is preferably MG²+. Furthermore, the concleave RNA of the NGO gene in the concleace and any beconcated with a cell to reduce of one or more cell and treat a patient having a condition associated with the level of the NGO. The treatment may further comprise the use of one or more

New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.

WPI; 2002-179446/23.

```
nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for protein variants having desired phenotypic improvements, and for case as immunogens to raise antibodies that specifically recognise may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as characteristic supplement in patients having specific deficiency in hGDMLP-1 production, and in vacatines or for replacement therapy. The production, and in vacatines or for replacement therapy. The production and secletal muscle disorders. HGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fig. wipo.int/pub/published_pot_sequence

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used an grobes to detect, characterise and quantify nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specifically recognise hGDMLP-1 proteins, as specifically recognise hGDMLP-1 proteins, as specific biomolecule and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as the requence or surface-enhanced laser desorption indisation, and production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production and with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hospithied muscle data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fire, wipo.int/pub/published_pct_sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; POSHL 1; SH3 domain; POSH-like signalling protein 1; oncoge:

```
The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSH1 1) polypeptide (I), comprising a sequence of 730 amino acids (SI, ABBB3999), a sequence having 55 sequence of dentity to (S1), (S1), having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSH1 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and mucleic acids (II) for identifying a specific binding partner. (I) and mucleic acids (II) caused by altered expression of human POSH1 including disease and treating caused by altered expression of human POSH1 including disease and (II) is treating cancer, they useful in the development of vaccines and (II) is treating cancer therapy. (II) is useful for constructing microarrapy which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples of the invention. Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to between by the European Patent Office
                                                                                                                                                           Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; POSHL 1; SH3 domain; POSH-like signalling protein 1; oncogene; Rho GTPase; signal transduction; gene expression; cancer; vaccine; gene therapy; transgenic; ss.

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (1), comprising a sequence of 730 amino protein 1 (POSHL 1) polypeptide (1), comprising a sequence of 730 amino (C. acids (S1, ABB8399), a sequence having 65% sequence identity to (S1), comprising the sequence comprising at least 8 contiguous amino sor a fragment of the sequence comprising at least 8 contiguous amino acide. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an cadaptor protein that interacts with Rho family small GTPsses as well as commister protein that interacts with Rho family small GTPsses as well as commister of the signal transduction pathway. (I) is useful of or identifying a specific binding partner. (I) and mucleic acids (II) conceding (I) are useful for diagnosable, monitoring disease and treating caused by altered expression of human POSHL1 including diagnosing and cuseful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating cuseful for measuring and for surveying gene expression and creating creating cance is sequence is that of a scanning oligonucleotide useful in examples contined specification, but is based on sequence information supplied to contine by the European Patent Office
                                                                                                                                                                                                                Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; POSHL 1; SH3 domain; POSH-like signalling protein 1; oncogene; Rho GTPase; signal transduction; gene expression; cancer; vaccine;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

(AEOM-) AEOMICA INC

Shannon M;

```
The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino cids (SI, ABBB3999), a sequence having 65% sequence of 6711, (S1), having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) for identifying a specific binding partner. (I) and nucleic acids (II) caused by altered expression of human POSHL1 including disease and treating caused by altered expression of human POSHL1 including microarraps which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples of the invention. Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to berwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                     Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
                                                                                                                                                                                                                                                                                                                                                                                                                  Example 2; SEQ ID NO 1821; 60pp + Sequence Listing; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 17 BP; 3 A; 9 C; 3 G; 2 T; 0 U; 0 Other;

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (S1, ABBB399), a sequence having 65% sequence identity to (S1), (C) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful of downstream components of the signal transduction pathway. (I) is useful of contentlying a specific binding partner. (I) and nucleic acids (II) contenting (I) are useful for diagnoshing, monitoring disease and treating caused by altered expression of human POSHL1 including diagnoshing and cruseful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligomucleotide useful in examples of prient specification, but is based on sequence information supplied to between by the European Patent Office
                                                                                               Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
                                                                                                                                                                                                                                                                                                                                 Example 2; SEQ ID NO 1822; 60pp + Sequence Listing; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 17 BP; 3 A; 9 C; 3 G; 2 T; 0 U; 0 Other;

The invention relates to a typing kit for judging human leukocyte antigen (HLA) genotype of a sample by hybridising a substrate on which 10-24 base oligonucleotides (ABLS) 12-ABLS1809) originating in the sequences of genes e.g. belonging to HLA class I antigens on human genome and containing gene polymorphisms as alloantigens have been immobilised as printers for amplification of cleaved nucleic acids relating to gene polymorphisms. The method is useful for judging HLA genotypes of individuals by determining immunogenetic differences before transplanting between them, providing genetic information to decide comparibility of organ and tissue for transplantation e.g. of bone marrow, kidney, liver, pancreas, Langerhans islet in pancreas and cornea, susceptibility diagnosis of genetic diseases and identifying individuals
                                                                                                                                                                                      Human leukocyte antigen (HLA) typing, useful for judging HLA genotypes of individuals e.g. by determining immunogenetic differences when transplanting between them.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acid sequences associated with tumor suppression, regression, apoptosis or virus resistance are useful to diagnose and treat viral

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, as sequence, with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that they indicates to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, indentifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors concaining the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral
                                                                                                        The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; gene chip; antisense; sense; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; protein chip; gene therapy; tumour suppression; human fukutin; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies
                                                                              This sequence represents an isolated nucleic acid sequence associated with tumour suppression or regression, apoptocisis or virus resistence. invention relates to these sequences or sequences having at least 80% identity to them, and polypeptides encoded by the sequences or polypeptides having 80% identity to the polypeptide sequences. The invention is used to disapnose or treat viral disease or disease characterized by development of tumour cells or cellular degeneration

diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in genetherapy. This polymucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Enzymatic nucleic acid; nuclear factor kappa B; NFKB; inozyme; zinzyme; GG-cleaver; amberzyme; cancer; REL-A activity; breast cancer; human; lung cancer; prostate cancer; colocectal cancer; brain cancer; oesophageal cancer; colocectal cancer; parceatic cancer; cervical cancer; pad and neck cancer; bladder cancer; panceatic cancer; cervical cancer; pad and neck cancer; cancer; panchago, glioma; multidrug resistant cancer; REL-A-specific inhibitor; chemotherapy; paclitear; resistant cancer; REL-A-specific inhibitor; gencitabine; radiation therapy; inflammatory disease; asthma; diabetes; rheumatoid arthritis; restenosis; Crohn's disease; asthma; diabetes; rheumatoid arthritis; restenosis; Crohn's disease; obesity; ischaemia; gene therapy; autoimmune disease; lupus; multiple sclerosis; sepsis; transplant/graft rejection; reperfusion injury; glomerulonephritis; allergic airway inflammatory bowel disease; infection; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel enzymatic nucleic acid molecules which down regulates expression a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.
                                                                                                                                                                                                                                                                                 Gapa

regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFRS), where (I) is an inozyme, zinzwe, G-Cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a partient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg^2^+. The enzymatic and antiense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, ossophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, genetiabline or radiation therapy. The enzymatic and antisense nucleic coid molecules are also useful for treating inflammatory disease such as chief and artificial settle for treating inflammatory disease such as the coid molecules are also useful for treating inflammatory disease such as the coid molecules are also useful for treating inflammatory disease such coid molecules are also useful for treating inflammatory disease such as coid molecules are also useful for treating inflammatory disease or cepting alray inflammation, inflammatory bowel disease or cepting alray inflammation, inflammatory bowel disease or cepting alray allergic alray inflammation, inflammatory bowel disease or conficion, gene therapy application, inflammatory bowel disease or conficion alray inflammation, inflammatory bowel disease or conficion alray and mycoardial), inflammatory bowel disease or conficion allergic alrays inflammation, inflammatory bowel disease or conficion and an order or septiments and an order or sequence represents the substrate of a novel enzymatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Enzymatic nucleic acid; nuclear factor kappa B; NFKB; inozyme; zinzyme; G-cleaver; amberzyme; cancer; REL-A activity; breast cancer; human; lung cancer; prostate cancer; colorectal cancer; brain cancer; colorectal cancer; pancreatic cancer; had and neck cancer; overlan cancer; melanoma; lymphoma; glioma; multidrug resistant cancer; REL-A-specific inhibitor; chemotherapy; paclitaxel; docetaxel; cisplatin; methotrexate; cyclophosphamide; doxorubin; fluorouracil carboplatin; edatrexate; gemcitabine; radiation therapy; inflammatory disease; asthma; diabetes; rheumatorid arthritis; restenosis; Crohn's disease; obesity; lachaemia; gene therapy; autoimmune disease; lupus; multiple sclerosis; sepsia; transplant/graft rejection; reperfusion injury; glomerulonephritis; allergic airway inflammation; inflammatory bowel disease; infection; ss.

```

The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFRS), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat carcer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg^2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or milidizug resistant cancer. The method involves use of other drug cervical, esistant cancer. The method involves use of other drug chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, colorhosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, canid molecules are also useful for treating inflammatory disease such as acid molecules are also useful for treating inflammatory disease such a cheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes, cobestiv, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemial. reperfusion injury, central nervous system (CNS) and myocardial), glomerulonephritis, signates and such and processes and service the service the such as a processes and serviced the service acid molecules are entered to an entered the service acid molecules are also useful for the service acid mol infection. This sequence represents the substrate of a novel enzymatic nucleic acid molecule

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.

Claim 3; Page 55; 72pp; English.

The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFRS), where (I) is an inozyme, zinzwe, G-Cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg^2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oespecially Mg^2+. The enzymatic and strictal, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, gemeitabline or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as acid molecules are also useful for treating inflammatory disease such as acid molecules. rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injury (central nervous system (CNS) and myocardial), glomerulonephritis, seppis, allergic airway inflammation, inflammatory bowel disease or infection. This sequence represents the substrate of a novel enzymatic nucleic acid molecule

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.

Claim 3; Page 31; 72pp; English.

The invention describes an enzymatic nucleic acid molecule (1) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFFD), where (1) is an inozyme, zinzyme, G-Cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in: a cell, for treating a patient having a condition associated with the level of REL-A. (1) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG^2+. The enzymatic and nisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, oervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or therapy including paclitaxal, docetaxel, cisplatin, methotrexate, chemotherapy including paclitaxal, docetaxel, cisplatin, methotrexate, cyclohosphamide, doxorubin, fluorouracil carboplatin, distrakate, cyclohosphamide, doxorubin, fluorouracil carboplatin, glioma nucleic acid molecules are also useful for treating inflammatory disease such as the method artificial, restenosis, asthma, Crohn's disease, diabetes,

cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A.

(I) is useful for clearing RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mc2+. The enzymatic and cantisense mucleic acid molecules are useful for traating breast, lung, prostate, colorectal, brain, oseophageal, stoomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug charpapies unch as monoclonal antibodies, REL-A specific inhibitors or cherapies use and antibodies, REL-A specific inhibitors or cherapy including paclitaxel, docetaxel, cisplatin, edatrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide doxorubin, fluorouracil carboplatin, edatrexate, candidation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such a chematoid arthritis, restenosis, suchaemia/reperfusion injury celection, gene therapy applications, isofaemia/reperfusion injury celection, gene therapy applications, isofaemia/reperfusion injury celection, gene therapy applications, isofaemia/reperfusion injury cepticion. This sequence represents the substrate of a novel enzymatic conception acid molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       G-cleaver, nucreary activity, breast cancer; human; lung cancer; moberzyme; cancer; REL-A activity; breast cancer; human; lung cancer; amberzyme; colorectal cancer; brain cancer; human; cesophageal cancer; colorectal cancer; brain cancer; prostate cancer; cervical cancer; head and neck cancer; ovarian cancer; melanoma; lymphoma; glioma; multidrug resistant cancer; REL-A-specific inhibitor; chemocherapy; paclitaxel; desistant cancer; REL-A-specific inhibitor; cyclophosphamide; doxorubin; fluorouracil carboplatin; edstrexate; gemcitabine; radiation therapy; inflammatory disease; asthma; diabetes; rheumatoid arthitis; restenosis; crohn's disease; obesity; isochaemia; gene therapy; autoimmune disease; lupus; multiple sclerosis; sepsis; transplant/graft rejection; reperfusion injury; glomerulonephritis; allergic airway inflammatory bowel disease; infection; ss.

The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor regulates expression of a sequence encoding a subunit of nuclear factor cancer and is useful for down-regulating REI-A activity in a cell, for cancer and is useful for down-regulating REI-A activity in a cell, for creating a patient having a condition associated with the level of REI-A. (I) is useful for cleaving RNA comprising a sequence of REI-A gene, in the presence of a divalent cation, especially Mg^2+ The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or unlittury resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REI-A-specific inhibitors or chemotherapy including paciltaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexace, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexace, cyclophosphamide, doxorubin, fluorouracil carboplatin, datrexace, cyclophosphamide, doxorubin, gone therapy applications, ischaemia/reperfusion injury (central nervous system (CMS) and myocardial), glomerulonephritis, cspsis, allergic airway inflammation, inflammatory bowel disease or infection. This sequence represents the substrate of a novel enzymatic inflection. This sequence represents the substrate of a novel enzymatic Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases. New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7 or MDZ12, e.g. cancer.

Gu Y, Nguyen C;

Shannon M,

WPI; 2003-423107/40.

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ12, MDZ12. MDZ3 is conceded at chromosome 7422.1, MDZ4 is encoded at chromosome 6721.3-22.2, MDZ7 is encoded at chromosome 6721.3-22.2, MDZ7 is encoded at chromosome 6721.3 and MDZ12 is encoded at chromosome 5721.2 and MDZ12 is encoded at chromosome secretarial and manufacturing a medicament for treating or preventing a disorder or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The probes are also be used as probes to detect and characterize gross alterations in MDZ3, MDZ7, or MDZ12 genetic locus. The probes are brotain are useful at therapeutic agents for gene therapy or as proteins are useful as therapeutic agents for gene therapy or as proteins are useful. ö Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger protein; MD21; MD24; MD212; MD212; chromosome 7q22.1; chromosome 6p21.3-22.2; chromosome 16p11.2; chromosome 15q26.1; cancer; developmental disorder; ss. The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ12, MDZ12. MDZ3 is encoded at Chromosome 7422.1, MDZ4 is encoded at Chromosome 6721.3-22.2, MDZ7 is encoded at chromosome 6721.3 and MDZ12 is encoded at chromosome 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, or immunifacturing a medicament for treating or preventing a disorder sesociated with Acreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as proteins. The present sequence was used to illustrate the invention.

Shannon M, Gu Y, Nguyen C; WPI; 2003-423107/40. New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7 or MDZ12, e.g. cancer.

Example 8; SEQ ID NO 403; 103pp; English.

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is encoded at chromosome 7922.1, MDZ4 is encoded at chromosome 6721.3-22.2, MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 15p11.2 and MDZ12 is encoded at chromosome 15p112.2 and MDZ12 is encoded at chr

or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for disgnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ12 genetic locus. The probes are proteins are useful as thereautic as microarrays for measuring gene expression. The proteins are useful as thereautic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention. %\$3888888888888

MDZ3 New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MD24, MD27 or MD212, e.g. cancer.

Example 8; SEQ ID NO 478; 103pp; English.

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is encoded at chromosome 7922.1, MD24 is encoded at chromosome for an encoded at chromosome for the modern is encoded at chromosome 15q26.1. The MD21 is encoded at chromosome 15q26.1. The MD24, MD24, MD21, and MD212 is encoded at chromosome is second in manufacturing a medicament for treating or preventing a disorder or in manufacturing a medicament for treating or preventing adjsorder or in massociated with decreased or increased expression or activity of MD23, MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic acids can also be used as probes to detect and characterize gross alterations in MD23, MD24, MD27, or MD212 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ12, MDZ12. MDZ3 is proteins and their coding sequences: MDZ3, MDZ4, MDZ12, MDZ12. MDZ3 is cancoded at chromosome f922.1.4, MDZ4 is encoded at chromosome f922.1.2, MDZ7 is encoded at chromosome f922.1.2, mDZ2 is encoded at chromosome f922.1.2 and MDZ12 is encoded at chromosome for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acide and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ1, or MDZ12. The nucleic acide can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as proteins are useful as therapeutic agents for gene therapy or as

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 7g21.3 MDZ4 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 15p13.2 and MDZ12 is encoded at chromosome 15g26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, 15g26.1. The MDZ3, MDZ4, MDZ12 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disease associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ1, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, or MDZ12, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as proteins are useful as therapeutic agents for gene therapy or as

```
The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-HER2, K-Ras, H-Ras, and HIV acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, shown in NBZS9889 - ABZ62216, ABZ64944 - ABZ65531, ABZ65520 - ABZ65524, ABZ65530 - ABZ65524 - ABZ65531, ABZ65531 - ABZ65524 - ABZ65531 - ABZ65531 - ABZ65524 - ABZ65531 - ABZ65531 - ABZ65534 - ABZ65531 - ABZ65534 - ABZ6554 - 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerthead ribozyme; DNAzyme; inozyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative, disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      RESULT 662
              윱
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is canceded at chromosome 7422.1, MDZ4 is encoded at chromosome 6721.2, MDZ7 is encoded at chromosome 6721.2, and MDZ12 is encoded at chromosome 1671.2 and MDZ12 is encoded at chromosome 1671.2 and MDZ12 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12, or MDZ12. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as proteins. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

```
The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV genes and/or HBV verse transcriptate the expression of HBV genes and MBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and enthods of the invention are useful for the treatment of degenerative and issues states related to HBV and HCV infection, replication and gene carcinoma. The present sequence represents a substrate for one of the HCV DNAzyme or minus strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                              Mcswiggen J, Morrissey D, Pavco P, Lee

```
The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HWV) DAN The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, an enzymatic nucleic acid such as hammerhead ribozymes, DNAzymes, an uncleic acid decoy molecules and G-cleaver ribozymes. Also disclosed a ranscriptase and/or HBV reverse transcriptase primer sequences, as well as oligomolectides that specifically bind the Enhancer I region of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene carcinoma. The present sequence represente a substrate for one of the HCV DNAZYME or minus strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and erzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, or inozymes, zinzymes, amberzymes, and G-cleaver ribozymes, DNAzymes, are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV genes and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene carcinoma. The present sequence represents a substrate for one of the HCV bindaryme or minus strand DNAzyme sequence disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                 Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; harmerthead ribozyme; DNAzyme; inozyme; zinzyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative, disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Mcswiggen J, Morrissey D, Pavco P,
                                                                                                                                     HCV minus strand DNAzyme substrate sequence #801
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 1; Page 289; 387pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to murine oligonucleotides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                       Cytostatic; virucide; neuroprotective; noctropic; neuroleptic; murine; tumour suppression; tumour reversion; apoptosis; virus resistance; viral disease; tumour; cell degeneration; cancer; Alzheimer's disease;

New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.

Disclosure; Page 333; 738pp; French.

The present invention relates to murine oligonucleotides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as grobes and primers for detecting, identifying are quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia

New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.

Disclosure; Page 486; 771pp; French

The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a fragments of at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying; quantifying and/or amplifying nucleotides, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing the mand cells containing the vectors), the encoded polypeptides and antibodies (AN) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzhelmer's disease or schizophrenia).

Charlysis of the expression of the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can be used to screen for their specific interactive molecules.

Charly useful for treating diseases associated with abnormal expression of the nucleotides

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This oligonuclectide was used in an example of synthesis of 3'- acridine-tailed oligonuclectide from acridine-CPG. Blockage of the 3' terminal phosphodiester bond improves resistance to nucleases in serum-contg. media. The new synthesis method avoids the derivatisation step of prior art methods and the possible loss and difficult separation. See AAQ22411-Q22415
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Solid support synthesis of 3'-tailedoligo-nucleotide(s) via linker gp. provides nuclease resistant prods. opt. with intercalation to improve anti-sense bonding to DNA or RNA strand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

Human Ship-2 phosphorothioate antisense oligonucleotide #30735.

22-MAY-2000 (first entry)

```
The present invention describes secreted and transmembrane polypeptides and their polymucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. AAZ33891 to AAZ34338, and AAX41665 to AAX41774 represent polynucleotide and polypeptide sequence given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New secreted and transmembrane polypeptides and their polymuclectides, useful for treating blood coagulation disorders, cancers and cellular adhesion disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Goddard A, Gurney A, Yuan J, Baker KP, Chen J;

```
The present invention describes phosphorothioate antisense cligonucleotides that specifically hybridise with, and inhibit the expression of, nucleic acids encoding human Ship-2 (also called SH2-containing phosphatidylinositol phosphatase-2). Also described is a method of inhibiting the expression of Ship-2 in human cells or tissues in vitro comprising contacting the cells with the phosphorothioate antisense oligonuclectides. The phosphorothioate antisense oligonuclectides. The phosphorothioate antisense oligonuclectides to be used to treat animals (especially humans) suspected of having or being prone to a disease or condition associated with Ship-2 expression. The present sequence represents a phosphorothioate antisense oligonucleotide for human Ship-2, from the

```
AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ7740 represent amplification primers for the biallelic markers. The biallelic markers of the invention primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex associations studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical afficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment. Pharmaceutical agents acting on a disease as well as other treatment.

When the second actually given a sequence in the Sequence Listing from the present invention
                                                                                                                                                                                                                                                                                       Novel biallelic markers used to construct a high density disequilibrium map of the human genome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human biallelic marker downstream amplification primer SEQ 1D NO:10930.

invention, which contains a polymorphic base at position 24 of their nucleotide sequences. AAZ68579 to AAZ7740 represent amplification primers for the biallelic markers of the biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyphag studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and dispossic methods, as well as the characterisation of the pharmaceutical as differential effications responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

N.B. The SEQ ID NOS 2852, 2913, 2974, 3055, 3056, 3157, 3227, 3297 and and also actually given a sequence in the Sequence Listing from the
                                                                                                                                               Novel biallelic markers used to construct a high density disequilibrium
                                                                                                                                                                                                                                AAZ65654 to AAZ69578 represent human biallelic markers from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, secreted protein, transmembrane protein, PRO, EST, cytostatic, expressed sequence tag, detection, cancer, PCR primer, probe; ss.

The present invention describes a method for distinguishing a human leukocyte antigen (HLA) class I antigen or allele by a combination of bolymerase chain reaction (PCR) using a primer pair whereby all HLA-A, -B or -C alleles can be amplified or using reverse hybridisation analysis comprising a DNA probe covalently bonded to microtitre plate wells which are hybridisable specifically with the base sequence of at least one specific HLA-A, -B or -C allele. The method is applicable in gene typing, judging donor-recipient compatibility during organ transplant and correlation analysis for diagnosis of various diseases. The method is simple, rapid and accurate, with possibility of mechanisation and automation, without the problems encountered by using the prior-art techniques. AAAA66943 to AAAA67072 represent oligonucleotide probes and PCR primers for use in the method of the present invention
                                                                                   Simple, rapid and accurate method for distinguishing HLA class I allele type with possibility of mechanization and automation, applicable in judging donor-recipient compatibility during organ transplant and disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Genetic clustering by distributing members into optimal numbers of clusters determined by a hierarchical clustering algorithm or by paired-pair analysis of homozygous pairs in clusters got from non-hierarchical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cluster; hierarchical clustering algorithm; population based study; clinical trial; DNA fingerprint; genetic profile analysis; PCR primer; SNP; single nucleotide polymorphism; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAC78458 to AAC78599 represent polynucleotide and EST (expressed sequence tag) sequences which encode secreted or transmembrane PRO polypeptides. The PRO polynucleotides and polypeptides have cytostatic activity. The polynucleotides and polypeptides can be used for detecting the presence of PRO polypeptides can be used for detecting the presence of PRO polypeptides on the presence of PRO polypeptides and for modilating bloodstal activities of cells, using the polypeptides for specific targeting. The polypeptide targeting can be used to kill the target cells, e.g. for the treatment of cancers. The polypeptide pairs provide specific targeting of bloactive molecules to cells. AAC78670 to AAC78897 represent PCR primers and probes used in the isolation of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The present invention relates to a method of determining polynucleotide expression, which comprises hybridising digested cDNA to a capture probe coupled to a solid particle under stringent conditions, where the capture probe is specific for the target polynucleotide and the particle identifies the capture probe. The method is useful for expression profiling, where the presence and/or the amount of a target polynucleotide is similtraneously determined, for diagnosing a disease, condition, disorder, or predisposition associated with a change in expression patterns, in determining the developmental or physiological state of a cell or tissue, for detecting SNPs, which may be used to screen individuals for a genetic predisposition to a disease, condition, or disorder, and in marker assisted selection. The present sequence is a hybridisation tag described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Determining polymucleotide expression, useful for expressing profiling or detecting single nucleotide polymorphisms, comprises hybridizing digested cDNA, to a capture probe coupled to a solid particle under stringent
            The present invention describes methods of clustering members of a sample, involving applying a hierarchical clustering algorithm to the sample members, determining the optimal number of clusters based on this and distributing the sample members into clusters using non-hierarchical cultstring. The methods are useful in population based studies such as clinical trials, DNA tingerprinting and genetic profile analyses. The present sequence was used to demonstrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acid analysis, microarray, single nucleotide polymorphism, SNP; multiplex, expression analysis; hybridisation tag; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to the isolation of novel human PRO polypoptides (AAU86128-AAU86162) and the polymucleotide sequences encoding them. The PRO polypeptides, agonists, antagonists or anti-PRO antibodies are useful for treating benign or malignant tumours (e.g. renal, kidney, bladder, breast, etc), leukaemias and lymphoid maligranoites, other discorders such as neuronal, glial, astrocytal, hypothalamic, glandular, macrochagal, stromal and blastocoelic disorders, inflammatory, immune and angiogenic disorders. The polynucleotide

The present invention describes a method for determining if an individual has a tumour cell or site of angiogenesis, or if a treatment is effective in changing angiogenesis or changing a status of a set of target cells, comprising determining it sample the subject has an expression product of at least one marker gene. Also described is a compound capable of altering the expression or activity of Keratin 14, TIE 1, Salioadhesin or Siglec, and kits containing them from the present invention can be used in a diagnostic method, particularly as an indicator of angiogenesis or to determine presence of a tumour cell. The method of the invention is suitable to determine within a few days if a certain treatment against Kaposi's Sarcoma is successful. ABQ81851 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Determining presence of a tumor cell or angiogenesis, and the offertiveness of marker genes is
sequences are also useful in gene therapy. The present sequence represents a PCR primer used in the methods of the present invention

first active agent comprising an oligonucleotide antisense to the first active agent comprising an oligonucleotide antisense to the first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genemic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 mucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antisthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchdilation, increasing levels of adenosine receptor, producing bronchdilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchconscription, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obsained in electronic format directly from WIPO Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or Human, antisense, lung dysfunction, nasal airway dysfunction, antinflammatory steroid, ubiquinone, antinflammatory; antiallergic, antiasthmatic; hypotensive; immunosuppressive, cytostatic; gene therapy; antisense gene therapy; respiratory; lung, adenosine sensitivity; adenosine receptor; bronchodiation; bronchoconstriction; lung allergy; lung inflammation; respiratory disease; ds. ä Nyce JW, Li Y, Sandrasagra A, Katz E, Pabalan J, Aguilar Miller S, Tang L, Shahabuddin S; 2.9%; Score 12.4; DB 1; Length 18; 92.9%; Pred. The invention describes an isolated nucleic acid (I) comprising, or which is at least 80 % sequence identity to, or the full-length coding sequence off, any of 118 300-2100 nucleotide sequences, which encodes its corresponding PRO polypeptide selected from 118 100-700 amino acid sequences, all given in the specification. The nucleic acids and polypeptides are useful for treating inflammatory diseases, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, cancer, or diabetic complications. The nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, and in generating antiseanse RNA or NNA. The polypeptides are useful as pharmaceuticals, diagnostics, blosensors or bioreactors. Both are useful in tissue typing. This sequence represents a novel human secreted and transmembrane PRO polypeptide associated primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New secreted and transmembrane nucleic acids and polypeptides, designated as PRO, useful for treating inflammation, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ashkenazi AJ, Baker KP, Botstein D, Desnoyers L, Eaton DL;

New isolated PRO polypeptides e.g. PRO213, PRO274 and PRO300, for use as pharmaceuticals, diagnostics, biosensors and bioreactors, for identifying modulators of receptor-ligand interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated secreted and transmembrane polypeptide, designated as PRO polypeptide. The PRO polypeptide is useful in PRO Polypeptide detection methods. The PRO polypeptide is useful for linking a bioactive molecule to a cell. The PRO polypeptide or an antibody against it is useful for modulating a biological activity of a cell. The PRO polypeptide is useful in industrial applications including
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ashkenazi AJ, Baker KP, Botstein D, Desnoyers L, Eaton DL;

pharmaceuticals, diagnostics, biosensors and bioreactors. The PRO polypeptide is also useful as a thrombolytic agent, interferon, chiraleukin, erythropoletin, colony stimulating factor and other cytochines. The PRO polypeptide is useful for treating disease such as crocer e.g. colorectal carcinoma; apoptosis related conditions e.g. AIDS, cancer e.g. colorectal carcinoma; inflammatory disease e.g. asthma, carborosclerosis; neurodegenerative disease e.g. Alzheimer's disease, Parkinson's disease; cardiovascular disease e.g. hypertension and glomerulonephritis; lung disease e.g. pulmonary hypertension and glomerulonephritis; lung disease e.g. pulmonary hypertension, bronchial asthma; gastrointestinal disorders e.g. pulmonary hypertension, bronchial component disease; reproductive disorders e.g. pulmonary hypertension, bronchial asthma; carcinogenesis. The present sequence represents a PRO polypeptide associated oligomucleotide of the invention. Note: The sequence data for this patent did not form part of the printed sequence atta for this patent did not form part of the printed special and the present control format directly from USPTO cat sequence. html?DocID=20020177553

The present invention relates to the isolation of novel human PRO CO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are useful for detecting other PRO polypeptides, for linking to polypeptides are useful for detecting other PRO polypeptides, for modulating bloogical activities of cells expressing PRO polypeptides, and for for identifying agonists or antagonists. The bloactive molecule maybe a coxin, radiolabel or antibody, and causes apoptosis or death of the cell. The PRO polypeptides are useful for treating immune disorders, diabetes or hypo-insulinaemia, cardiac insufficiency, nervous system cisorders, kidney disorders, bone and cartilage disorders or arthritis, tumours, and wound healing. The polymoclectide sequences encoding PRO polypeptides are useful as hybridiation probes, in chromosome and gene compaping, in the generation of antisense RNA and DNA, in the preparation of propagation of antisense RNA and DNA, in the preparation of an immals, for the generation of antisense RNA and DNA, in the preparation of an immals, for the generatic sequence represents a PCR primer used in the examples of the present invention. Note: The sequence data for this compactual as equent as obtained in electronic format directly from the USPTO web site are sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; 88; PCR; secreted protein; transmembrane protein; PRO; primer; malignancy; cancer; ovarian cancer; colorectal cancer; sarcoma; leukaemia; lymphoma; inflammatory disease; necrosis; atherosclerosis; infertility; premature aging; psoriasis; inflammatory disease; renal disease; arthritis; immune-mediated alopecia; stroke; encephalitis; hepatitis; multiple sclerosis; gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Shelton DL;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention describes an isolated secreted and transmembrane (PRO) polypeptide (I). PRO337 polypeptide is useful for detecting PRO4993 polypeptide in a sample, and vice versa. PRO725, PRO700 and PRO4993 useful for detecting PRO155, PRO700 and PRO159 are useful for detecting PRO155, PRO700 and PRO393 is useful for linking a bioactive molecule to a cell expressing a PRO337 polypeptide, and PRO337 is useful for linking a bioactive molecule to a cell expressing a PRO493 polypeptide. PRO1559 is useful for linking a bioactive molecule for bioactive molecule collecule of a cell expressing a PRO493 polypeptide. PRO1559 is useful for linking a bioactive molecule et all expressing a PRO493 polypeptide. PRO1559 PRO700 and PRO739 polypeptides are useful for

```
The invention describes an isolated, secreted and transmembrane polypeptide, termed PRO polypeptide (I). (I) is useful for detecting PRO4993, PRO3179, PRO4993, PRO725, PRO7025, PRO7039 polypeptide, and for linking a bioactive molecule to a call expressing the above polypeptides. The bioactive molecule is a toxin, radiolabel or an antibody and causes cell death. (I) is useful as therapeutic agent, in medical and industrial applications e.g. for treating neuropathy, especially peripheral neuropathy, dibS-associated neuropathy, charcot-Marie-Tooth disease, Refusum's disease, Abetalipoproteinaemia, Tangier disease, Krabbe's disease, Metachromatic leukodystrophy, Pabry's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ashkenazi AJ, Baker KP, Botstein D, Desnoyers L, Eaton DL; Ferrara N, Filvaroff E, Fong S, Gao W, Gerber H, Gerritsen ME; Goddard A, Godowski PJ, Grimaldh JC, Gurney AL, Hillan KJ; Kliavin IJ, Kuo SS, Napier MA, Pan J, Paoni NF, Roy MA, Shelton DL; Stewart TA, Tumas D, Williams PM, Wood WL;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel secreted and transmembrane polypeptide for modulating biological activity of cell expressing the polypeptide, identifying agonists or antagonists of polypeptide, and as molecular weight markers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

The present invention relates to the isolation of novel human PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are useful for detecting other PRO polypeptides, for linking bioactive molecules to cells expressing PRO polypeptides, for modulating biological activities of cells expressing PRO polypeptides, and for toxin, radiolabel or antibody, and cause cell death. The PRO polypeptides are useful for treating neuropathy and neuropathy related diseases such as Charcher-Marie-Tooth disorder, Refenum's diseases, and Krabbe's disease. The polynucleotide sequences encoding PRO polypeptides are useful as hybridisation probes, in chromosome and gene mapping, in the generation of antisense RNA and DNA, in the preparation of PRO polypeptides, for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, 88; PCR, secreted protein; transmembrane protein; PRO; cytostatic; ophthalmological; antiarthritic; osteopathic; antirheumatic; vulnerary; auditory; tumour growth; retinal disorder; sports-related joint problem; articular cartilage defects; osteoarthritis; rheumatoid arthritis; wound healing; hearing loss; primer.
                                                                                 New PRO polypeptides useful for treating peripheral neuropathy, neuropathies associated with systemic disease such as post-polio syndrome or AIDS-associated syndrome.
                                                                                                                                                                                                                                                                                                                                                                                    Query Match
